

# ISO 400/27°, FINE GRAIN, BLACK AND WHITE PROFESSIONAL FILM FOR SUPERB PRINT QUALITY

ILFORD DELTA 400 PROFESSIONAL is a fast, fine grain, black and white professional film. It is ideal for action and available light photography, and also gives fine grain results for pictorial and fine art photography. DELTA 400 Professional film gives excellent performance in seasoned developers.

Although rated at ISO 400/27°, DELTA 400 Professional film can produce high quality prints when exposed at meter settings up to El 3200/36 and given extended development in ILFORD ILFOTEC DD-X, ILFOTEC HC, MICROPHEN or ILFOTEC RT RAPID developers.

DELTA 400 Professional 35mm film is coated on 0·125mm/5-mil acetate base and is available in 24 or 36 exposure cassettes, or in bulk lengths of 30·5 metres (100ft). DELTA 400 Professional 35mm film is supplied in DX coded cassettes, suitable for all 35mm cameras.

DELTA 400 Professional rollfilm is coated on 0.110mm/4-mil clear acetate base with an antihalation backing which clears during development. It is available in 120 lengths and is edge numbered 1 to 19.

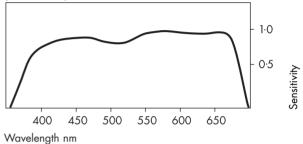

#### **EXPOSURE RATING**

DELTA 400 Professional has a speed rating of ISO 400/27° (400ASA, 27DIN, EI 400/27) to daylight. The ISO speed rating was measured using ILFORD ID-11 developer at 20°C/68°F with intermittent agitation in a spiral tank.

Best results will be obtained at normal contrast, but good image quality will also be obtained at meter settings from El 200/24 to El 3200/36.

It should be noted that the exposure index (EI) range recommended for DELTA 400 Professional is based on a practical evaluation of film speed and is not based on foot speed, as is the ISO standard.

#### SPECTRAL SENSITIVITY Wedge spectrogram to tungsten light (2850K)

#### **FILTER FACTORS**

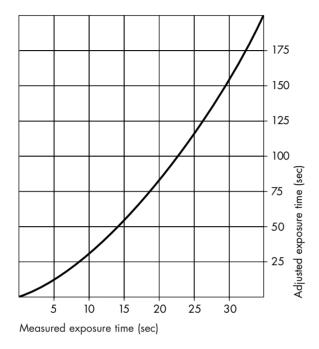

DELTA 400 Professional film can be used with all types of filters (eg colour, polarising and neutral density filters) in the usual way. Follow the instructions given by the filter manufacturer.

The exposure increase in daylight may vary with the angle of the sun and the time of day. In the late afternoon or the winter months, when daylight contains more red light, green and blue filters may need slightly more exposure than usual.

Cameras with through-the-lens metering will usually adjust the exposure automatically when using filters. With some automatic exposure cameras, the correction given for deep red and orange filters can produce negatives under exposed by as much as  $1 \frac{1}{2}$  stops.

#### **MAKING LONG EXPOSURES**

For exposures between  $\frac{1}{2}$  and  $\frac{1}{10000}$  second, no adjustments are needed for reciprocity law failure. When exposures longer than  $\frac{1}{2}$  second are given, DELTA 400 Professional, along with other films, needs to be given more exposure than indicated by a meter. Use the graph to calculate the increased exposure time which should be given once the measured time is known.

### CHOOSING THE BEST ILFORD DEVELOPER FOR THE JOB

DELTA 400 Professional will give good results in a wide range of developers when exposed at meter settings up to El 3200/36. After choosing your developer, refer to the development times table to check the meter setting needed with that developer.

#### CHOOSING THE BEST ILFORD DEVELOPER FOR THE JOB Manual processing (eg spiral tank, dish/tray, deep tank) and rotary processors

#### **DEVELOPMENT TIMES**

The table gives development times for processing DELTA 400 Professional film. The times in bold will produce negatives of normal contrast ( $\overline{G}0.62$ ). The development times are intended as a guide and may be altered if a different result is needed.

For manual processing in spiral tanks and deep tanks, the development times are based on

DELTA 400 PROFESSIONAL

intermittent agitation. Where continuous agitation is used for manual processing (as in a dish/tray or with some types of developing tank), reduce these times by up to 15%. For use in rotary processors without a pre-rinse, reduce the spiral tank development times by up to 15%. A pre-rinse is not recommended because it can lead to uneven processing.

**Note** Development times may need adjusting to suit individual processing systems and working practices. If an established system is producing good results, adjust the recommended development times until the desired contrast level is obtained. **Note** Development times in other manufacturers' developers are included for your convenience, and are only a general guide. Other manufacturers can and do change their product specifications from time to time, and the development times may change as a result.

#### PROCESSING AT DIFFERENT TEMPERATURES

DELTA 400 Professional film can be processed over a range of temperatures. Development at  $20^{\circ}C/68^{\circ}F$  or  $24^{\circ}C/75^{\circ}F$  is recommended and the times are given in the development times table. If development is not possible at  $20^{\circ}C/68^{\circ}F$  or  $24^{\circ}C/75^{\circ}F$ , the following chart can be used. The chart is based at  $20^{\circ}C/68^{\circ}F$  for a general developer, and can be used to give an estimate of development times at temperatures around  $20^{\circ}C/68^{\circ}F$ .

For example, if 6 minutes at  $20^{\circ}C/68^{\circ}F$  is recommended, the time at  $23^{\circ}C/73^{\circ}F$  will be  $4^{1/2}$  minutes and the time at  $16^{\circ}C/61^{\circ}F$  will be 9 minutes.

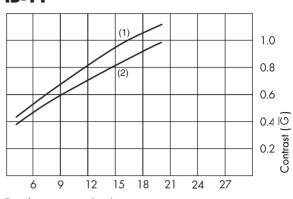

New development time (min)

**Note** The chart can only be used as a guide because different developers and processing techniques can vary the results.

#### **CONTRAST-TIME GRAPHS**

The following graphs show the contrast of DELTA 400 Professional negatives when developed over a range of development times.

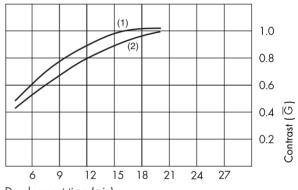

Development time (min)

DELTA 400 Professional film developed in ILFORD ID-11 stock at (1)  $24^{\circ}C/75^{\circ}F$  and (2)  $20^{\circ}C/68^{\circ}F$ .

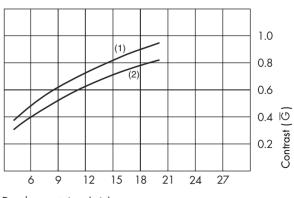

#### MICROPHEN

Development time (min)

DELTA 400 Professional film developed in ILFORD MICROPHEN stock at (1) 24°C/75°F and (2) 20°C/68°F.

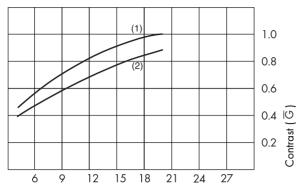

#### PERCEPTOL

Development time (min)

DELTA 400 Professional film developed in ILFORD PERCEPTOL stock at (1) 24°C/75°F and (2) 20°C/68°F.

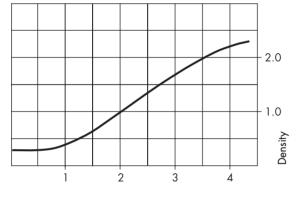

#### **ILFOTEC DD-X**

Development time (min)

DELTA 400 Professional film developed in ILFORD ILFOTEC DD-X 1+4 at (1) 24°C/75°F and (2) 20°C/68°F.

#### **CHARACTERISTIC CURVE**

Relative log exposure

DELTA 400 Professional 35mm film developed in ILFORD ID-11 stock for 8 minutes at 24°C/75°F with intermittent agitation.

#### PROCESSING

DELTA 400 Professional film can be processed in all types of processing equipment including spiral tanks, rotary processors, dishes/trays, deep tanks and automatic processors. Standard capacity figures and replenishment rates can be maintained. When fixing DELTA 400 Professional film, however, slightly longer times than used with conventional film are recommended for best results.

#### Safelight recommendations

Handle DELTA 400 Professional film in total darkness. For very brief inspections during processing, use the ILFORD 908 (very dark green) safelight filter, with a 15W bulb, fitted in a darkroom lamp (such as the ILFORD DL10 or DL20). Do not allow direct lighting from the safelight to fall on the film.

#### Agitation

Intermittent agitation is recommended for use in spiral tanks and deep tanks. With spiral tanks, invert the tank four times during the first 10 seconds, then invert the tank four times again during the first 10 seconds of each further minute. Continuous agitation is recommended in dishes/trays. Otherwise, follow the recommendations given by the processing equipment manufacturer.

#### **Fixation**

After development, rinse the film in water or ILFORD ILFOSTOP or ILFOSTOP PRO stop bath (1+19) for 30 seconds at 20°C/68°F, and fix in ILFORD HYPAM or ILFORD UNIVERSAL RAPID fixer (1+4) for 3–5 minutes at 20°C/68°F. A hardener is recommended only when processing at high temperatures (above 30°C/86°F) or in a roller transport processor.

#### Washing

Where a non-hardening fixer, such as HYPAM or UNIVERSAL RAPID, has been used, wash the film in running water for 5–10 minutes at a temperature within  $5^{\circ}C/9^{\circ}F$  of the processing temperature.

For spiral tank use, when a non-hardening fixer has been used, the following method of washing is recommended. This method of washing is faster, uses less water yet still gives negatives suitable for long term storage.

1 Process the film in a spiral tank.

2 Fix it using HYPAM or UNIVERSAL RAPID fixer.

3 After fixation, fill the tank with water at the same temperature as the processing solutions, and invert it five times.

4 Drain the water away and refill. Invert the tank ten times.

5 Drain and refill it for the third time and invert the tank twenty times. Drain the water away.

A final rinse in water to which a few drops of ILFORD ILFOTOL (1+200) wetting agent have been added will aid rapid and uniform drying.

#### Drying

To avoid drying marks, use a clean squeegee or chamois cloth to wipe DELTA 400 Professional film before hanging it to dry. Dry DELTA 400 Professional film at 30–40°C/86-104°F in a drying cabinet or at room temperature in a clean dust-free area.

#### STORAGE

Store DELTA 400 Professional film in a cool (10–20°C/50-68°F), dry place in its original packaging.

#### **Exposed film**

Once exposed, process DELTA 400 Professional film as soon as practical. Images on exposed but unprocessed film will not degrade for several months when stored as recommended.

#### Negatives

Store processed negatives in a cool  $(10-20^{\circ}C/50-68^{\circ}F)$ , dry place, in the dark. Suitable storage sleeves include those made of cellulose triacetate, Mylar, paper (pH6·5–7·5) or inert polyester.

A wide range of fact sheets is available which describe and give guidance on using ILFORD products.
